# Package 'Capr'

April 4, 2023

```
Title Cohort Definition Application Programming
Version 2.0.2
Description Provides a programming language for defining OHDSI cohort defini-
      tions in R to use in studies for Observational
      Health Data Sciences and Informatics (OHDSI). The functions in 'Capr' allow for the program-
      matic creation of
      OHDSI concept sets and cohorts that can be serialized to 'Atlas/CIRCE-
      BE' compatible 'json' files or to 'OHDSI-SQL'.
      'Capr' functions can be used to create, save, and load component parts to a cohort definition al-
      lowing
      R programmers to easily reuse cohort logic. 'Capr' provides tools to create a large num-
      ber of OHDSI cohorts
      programmatically while also helping bridge the gap between human readable descrip-
      tions of clinical phenotypes
      and their computational implmentation.

==	FUnction checks if two concept set class objects are equivalent	

## Description

FUnction checks if two concept set class objects are equivalent

## Usage

4

```
## S4 method for signature 'ConceptSet, ConceptSet'
e1 == e2
```

## Arguments

e1, e2 a ConceptSet Class object

Function to create age attribute age

## Description

Function to create age attribute

## Usage

age(op)

## Arguments

ор

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible patient age

```
as.data.frame,ConceptSet-method
```

Coerce a concept set expression to a dataframe

#### **Description**

Coerce a concept set expression to a dataframe

#### Usage

```
## S4 method for signature 'ConceptSet'
as.data.frame(x)
```

## **Arguments**

Х

A Caper Concept Set

#### Value

 $A\ tibble\ (data frame)\ with\ columns:\ concept\_id,\ include Descendants,\ is Excluded,\ include Mapped.$ 

as.json

Coerce Capr object to json

## Description

Coerce Capr object to json

## Usage

```
as.json(x, pretty = TRUE, ...)
## S4 method for signature 'ConceptSet'
as.json(x, pretty = TRUE, ...)
## S4 method for signature 'Cohort'
as.json(x, pretty = TRUE, ...)
```

#### **Arguments**

```
x the capr objectpretty a toggle to make the json look nice, part of jsonlite... additional arguments passes to jsonlite::toJSON
```

6 atMost

atLeast	Function to enumerate an minimal count of occurrences

## **Description**

Function to enumerate an minimal count of occurrences

## Usage

```
atLeast(x, query, aperture = duringInterval(eventStarts(-Inf, Inf)))
```

#### **Arguments**

x the integer counting the number of occurrences

query a query object that provides context to the clinical event of interest

aperture an eventAperture object that shows the temporal span where the event is to be

observed relative to the index event

atMost Function to enumerate a maximum count of occurrences

## Description

Function to enumerate a maximum count of occurrences

## Usage

```
atMost(x, query, aperture = duringInterval(eventStarts(-Inf, Inf)))
```

#### **Arguments**

x the integer counting the number of occurrences

query a query object that provides context to the clinical event of interest

aperture an eventAperture object that shows the temporal span where the event is to be

observed relative to the index event

attrition 7

attrition

Create a cohort attrition object

#### **Description**

Create a cohort attrition object

## Usage

```
attrition(..., expressionLimit = c("First", "All", "Last"))
```

## **Arguments**

```
... Capr groups expressionLimit
```

how to limit initial events per person either First, All, or Last

bt

Between operator

## **Description**

function that builds an opAttribute based on between logic

## Usage

```
bt(x, y)
## S4 method for signature 'integer'
bt(x, y)
## S4 method for signature 'numeric'
bt(x, y)
## S4 method for signature 'Date'
bt(x, y)
```

## **Arguments**

У

x the left side bound of the between logic This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

the right side bound of the between logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

8 cohort

CensoringCriteria-class

An S4 class identifying a censoring criteria for the cohort

## Description

The censoring criteria specifies events where the person exits the cohort. These events are based on a query class object and users can specify multiple queries in the censoring criteria.

#### **Slots**

criteria a list of Capr query class objects that specify the events that would lead a person to exit the cohort.

censoringEvents

Constructor for a set of censoring events

#### **Description**

Constructor for a set of censoring events

## Usage

```
censoringEvents(...)
```

## **Arguments**

a list of Capr query objects that are used as censoring events

cohort

Function that creates a cohort object

## Description

Function that creates a cohort object

#### Usage

```
cohort(entry, attrition = NULL, exit = NULL, era = NULL)
```

#### **Arguments**

entry the index event of the cohort

attrition rules that restrict the cohort further, developing attrition

exit the event where the person exits the cohort

era Cohort era (collapse) logic created with the 'cohortEra' function

compile.Cohort 9

compile.Cohort

Compile a Capr cohort to json

## Description

Compile a Capr cohort to json

## Usage

```
compile.Cohort(object, ...)
```

#### **Arguments**

object A Capr cohort or list of Capr cohorts

... Arguments passed on to jsonlite::toJSON. e.g. 'pretty = TRUE' for nicely for-

matted json.

#### Value

The json representation of Capr cohorts

#### **Examples**

```
## Not run:
ch <- cohort(condition(cs(1,2)))
compile(ch)
## End(Not run)</pre>
```

Concept-class

An S4 class for a single OMOP Concept

#### **Description**

A concept class contains all the information about the concept from the OMOP voabulary.

## **Slots**

```
concept_id the OMOP/OHDSI concept ID

concept_name the name of the concept
standard_concept whether the concept is standard 'S', classification 'C', or non-standard NA
standard_concept_caption Whether the concept is standard full phrase
invalid_reason Whether the concept is invalid single letter
invalid_reason_caption whether the concept is invalid standard phrase
concept_code The original code of the concept from its vocabulary
domain_id The domain of the concept (e.g. Drug, Condition, Procedure, etc)
vocabulary_id the name of the vocabulary
concept_class_id type of concept class
```

10 ConceptSetItem-class

conceptAttribute-class

An S4 class for a concept attribute

## **Description**

An S4 class for a concept attribute

#### **Slots**

name the name of the attribute conceptSet a list representing the concepts for the attribute

ConceptSet-class

An S4 class for ConceptSetExpresion

#### **Description**

A class for the concept set expressions bundles multiple concepts with mapping

#### **Slots**

id an id for the concept set expression to identify within a component

Name the name of the concept set expression

Expression a list containing expressions. expressions include multiple conceptSetItem objects

ConceptSetItem-class An S4 class for ConceptSetItem

## Description

A class that provides information on the mapping of the concept

#### **Slots**

Concept a concept class object
isExcluded toggle if want to exclude the concept
includeDescendants toggle if want to include descendants
includeMapped toggle if want to include map

condition 11

condition

Query the condition domain

## Description

Query the condition domain

## Usage

```
condition(conceptSet, ...)
```

## **Arguments**

conceptSet A condition concept set
... optional attributes

#### Value

A Capr Query

conditionEra

Query the condition era domain

## Description

Query the condition era domain

## Usage

```
conditionEra(conceptSet, ...)
```

## Arguments

```
conceptSet A condition concept set
... optional attributes
```

## Value

A Capr Query

12 cs

 ${\tt continuousObservation} \ \ \textit{A function to construct the observationWindow}$ 

## Description

A function to construct the observationWindow

## Usage

```
continuousObservation(priorDays = 0L, postDays = 0L)
```

#### **Arguments**

priorDays	minimum number of observation days prior to the cohort index. Default 0 days
postDays	minimum number of observation days post cohort index. Default 0 days

Criteria-class An S4 for a criteria

#### **Description**

a criteria is a temporal observation of a clinical event relative to the index event

#### **Slots**

occurrence an occurrence object specifying how many events must occur to consider the event as part of the cohort definition

query a query object that provides context to the clinical event of interest

aperture an eventAperture object that shows the temporal span where the event is to be observed relative to the index event

cs

Create a concept set

## Description

cs is used to create concept set expressions.

'exclude' is meant to be used inside 'cs' when creating a new concept set.

'mapped' is meant to be used inside 'cs' when creating a new concept set.

'descendants' is meant to be used inside 'cs' when creating a new concept set.

cs 13

#### Usage

```
cs(..., name = "", id = NULL)
exclude(...)
mapped(...)
descendants(...)
```

## **Arguments**

One or more numeric vectors that can be coerced to integers, or Calls to helper functions "exclude", "descendants", or "mapped".
 A name for the concept set
 An id for the concept set

#### Value

A Capr Concept Set Object

A list of Capr concepts

A list of Capr concepts

A list of Capr concepts

## **Functions**

• exclude(): exclude concepts

• mapped(): Include mapped concepts

• descendants(): Include descendants

## **Examples**

```
## Not run:
cs(1, 2)
cs(1, c(1, 10, 2))
cs(1, seq(2, 10, 2))
cs(1, 2, 3, exclude(4, 5))
cs(1, 2, 3, exclude(4, 5), mapped(6, 7))
cs(1, 2, 3, exclude(4, 5), mapped(6, 7), descendants(8, 9))
cs(descendants(1, 2, 3), exclude(descendants(8, 9)))
## End(Not run)
```

14 death

daysOfSupply

Function to create days supply attribute

## Description

This function is used only for a drug query. days supply is a column in the drug exposure table of the cdm. This attribute allows a subquery to find drugs that satisfy certain values determined by the op logic.

## Usage

```
daysOfSupply(op)
```

## **Arguments**

ор

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible number of days of supply

death

Query the condition era domain

## Description

Query the condition era domain

## Usage

```
death(conceptSet = NULL, ...)
```

## Arguments

```
conceptSet A condition concept set
... optional attributes
```

#### Value

A Capr Query

drug 15

drug

Query the drug domain

## Description

Query the drug domain

## Usage

```
drug(conceptSet, ...)
```

## **Arguments**

```
conceptSet A drug concept set
... optional attributes
```

## Value

A Capr Query

drugEra

Query the drug era domain

## Description

Query the drug era domain

## Usage

```
drugEra(conceptSet, ...)
```

## Arguments

```
conceptSet A drug ingredient concept set
... optional attributes
```

## Value

A Capr Query

drugExit

Function to create an exit based on exit based on the end of a continuous drug exposure

#### **Description**

Function to create an exit based on exit based on the end of a continuous drug exposure

#### Usage

```
drugExit(
  conceptSet,
  persistenceWindow = 0L,
  surveillanceWindow = 0L,
  daysSupplyOverride = NULL
)
```

## **Arguments**

conceptSet the concept set of the drug exposure used to identify the exit

persistenceWindow

allow for a maximum of days between exposure records when inferring the era of persistence exposure

surveillanceWindow

add days to the end of the era of persistence exposure as an additional period of surveillance prior to cohort exit

daysSupplyOverride

force drug exposure days supply to a set number of days

DrugExposureExit-class

An S4 class for a cohort exit based on continuous exposure persistence.

## Description

Specify a concept set that contains one or more drugs. A drug era will be derived from all drug exposure events for any of the drugs within the specified concept set, using the specified persistence window as a maximum allowable gap in days between successive exposure events and adding a specified surveillance window to the final exposure event. If no exposure event end date is provided, then an exposure event end date is inferred to be event start date + days supply in cases when days supply is available or event start date + 1 day otherwise. This event persistence assures that the cohort end date will be no greater than the drug era end date.

drugQuantity 17

#### **Slots**

conceptSet the concept set of the drug exposure used to identify the exit

persistenceWindow allow for a maximum of days between exposure records when inferring the era of persistence exposure

surveillanceWindow add days to the end of the era of persistence exposure as an additional period of surveillance prior to cohort exit

daysSupplyOverride force drug exposure days supply to a set number of days

count an integer specifying the number of occurrences for a criteria

drugQuantity

Function to create quantity attribute

## **Description**

This function is used only for a drug query. quantity is a column in the drug exposure table of the cdm. This attribute allows a subquery to find drugs that satisfy certain values determined by the op logic.

#### Usage

```
drugQuantity(op)
```

#### **Arguments**

ор

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible quantity

drugRefills

Function to create refills attribute

## **Description**

This function is used only for a drug query. refills is a column in the drug exposure table of the cdm. This attribute allows a subquery to find drugs that satisfy certain values determined by the op logic.

#### Usage

```
drugRefills(op)
```

## **Arguments**

ор

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible number of refills

18 endDate

duringInterval	Function that creates an eventAperture an opening where an event can
dui ingintei vai	occur relative to the index event

## Description

Function that creates an eventAperture an opening where an event can occur relative to the index event

## Usage

```
duringInterval(
   startWindow,
   endWindow = NULL,
   restrictVisit = FALSE,
   ignoreObservationPeriod = FALSE
)
```

#### **Arguments**

startWindow the starting window where an event can occur

endWindow the end window of where an event can occur. This parameter is optional

restrictVisit a logical toggle specifying whether the event should occur on the same visit

ignoreObservationPeriod

a logical toggle specifying whether we can consider events outside the observa-

tion period

endDate

Function that creates a end date attribute

#### **Description**

Function that creates a end date attribute

## Usage

```
endDate(op)
```

#### **Arguments**

ор

an opAttribute object must be a date that defines the logical operation used to determine eligible end dates

Endpoint-class 19

Endpoint-class

An S4 class for an Endpoint

#### **Description**

this determines the time in days relative to an index either before or after

#### **Slots**

days either a character string all or an integer for the number of days coeff a character string either before or after

entry

Create a cohort entry criteria

#### **Description**

Create a cohort entry criteria

## Usage

```
entry(
    ...,
    observationWindow = continuousObservation(0L, 0L),
    primaryCriteriaLimit = c("First", "All", "Last"),
    additionalCriteria = NULL,
    qualifiedLimit = c("First", "All", "Last")
)
```

#### **Arguments**

## Value

A cohort entry Capr object

20 era

eq Equal to operator

#### **Description**

function that builds an opAttribute based on equal to logic

#### Usage

```
eq(x)
## S4 method for signature 'integer'
eq(x)
## S4 method for signature 'numeric'
eq(x)
## S4 method for signature 'Date'
eq(x)
```

#### **Arguments**

Х

the value to used as a bound in the op logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

era

Create a Cohort Era class object

## Description

The Cohort Era depicts the time span of the cohort. The Censor Window includes the date window for which we register events. The Collapse Settings identify the era padding between events before exiting a cohort.

## Usage

```
era(eraDays = 0L, studyStartDate = NULL, studyEndDate = NULL)
```

## Arguments

```
eraDays a numeric that specifies the number of days for the era padding studyStartDate a date string that specifies the starting date of registration studyEndDate a date string that specifies the end date of registration
```

EventAperture-class 21

EventAperture-class An S4 class for Aperture

#### **Description**

The aperture class provides context to when the criteria must be observed in a person timeline to pretain to the expression

#### **Slots**

startWindow a EventWindow class object identifying the start window
endWindow a EventWindow class object ifentifying the end window (optional)
restrictVisit a logic toggle where TRUE restricts to the same visit
ignoreObservationPeriod a logic toggle where TRUE allows events outside the observation period

eventEnds

Function creates an event window where the event ends

## Description

Function creates an event window where the event ends

## Usage

```
eventEnds(a, b, index = c("startDate", "endDate"))
```

## Arguments

a the left side of the event window

b the right side of the event window

index specifying what part of the index we start looking for events either at the index

start date or index enddate

22 EventWindow-class

eventStarts

#' A function to offset the number of days relative to index #' @param days a number specifying the number of days to offset from index where #' an event may be observed. In this function a negative number means days before index #' and a postive number means days after index. #' @export offset <- function(days) coeff <- dplyr::if\_else(sign(days) == 1, "after", "before", "before") new("Endpoint", days = as.integer(abs(days)), coeff = coeff)

## **Description**

```
#' Function looking at all time before an event #' @export allDaysBefore <- function() new("Endpoint", days = "all", coeff = "before")
```

#### Usage

```
eventStarts(a, b, index = c("startDate", "endDate"))
```

## Arguments

a the left side of the event windowb the right side of the event window

index specifying what part of the index we start looking for events either at the index

start date or index enddate

#### Details

#' Function looking at all time after an event #' @export allDaysAfter <- function() new("Endpoint", days = "all", coeff = "after")

Function creates an event window where the event starts

EventWindow-class

An S4 class for a Window

#### **Description**

A window class provides details on the end points of the timeline

## **Slots**

event a character string either start or end. Identifies the point of reference for the window start an endpoint object containing the days and coefficient for the start of the window end an endpoint object containing the days and coefficient for the end of the window index A character string either start or end. Identifies where the index is relative to the window

exactly 23

		_
exa	ct	:1 v

Function to enumerate an exact count of occurrences

## Description

Function to enumerate an exact count of occurrences

## Usage

```
exactly(x, query, aperture = duringInterval(eventStarts(-Inf, Inf)))
```

#### **Arguments**

x the integer counting the number of occurrences

query a query object that provides context to the clinical event of interest

aperture an eventAperture object that shows the temporal span where the event is to be

observed relative to the index event

exit

Function that creates a cohort exit object

## Description

Function that creates a cohort exit object

#### Usage

```
exit(endStrategy, censor = NULL)
```

## Arguments

endStrategy the endStrategy object to specify for the exit censor the censoring criteria to specify for the exit

firstOccurrence

Add first occurrence attribute

## Description

Add first occurrence attribute

## Usage

firstOccurrence()

## Value

An attribute that can be used in a query function

FixedDurationExit-class

An S4 class for a cohort exit based on fixed duration persistence.

#### **Description**

The event end date is derived from adding a number of days to the event's start or end date. If an offset is added to the event's start date, all cohort episodes will have the same fixed duration (subject to further censoring). If an offset is added to the event's end date, persons in the cohort may have varying cohort duration times due to the varying event durations (such as eras of persistent drug exposure or visit length of stay). This event persistence assures that the cohort end date will be no greater than the selected index event date, plus the days offset.

#### **Slots**

index specification of event date to offset offsetDays an integer specifying the number of days to offset from the event date

fixedExit

Function to create an exit based on exit based on the end of a continuous drug exposure

#### **Description**

Function to create an exit based on exit based on the end of a continuous drug exposure

#### Usage

```
fixedExit(index = c("startDate", "endDate"), offsetDays)
```

#### **Arguments**

index
offsetDays

specification of event date to offset. Can be either startDate or endDate an integer specifying the number of days to offset from the event date

generateCaprTemplate

Generate a Capr cohort using a template

## **Description**

Generate a Capr cohort using a template

## Usage

```
generateCaprTemplate(file, .capr)
```

#### **Arguments**

file the input file of a concept set
.capr a function that creates a capr cohort

getConceptSetCall 25

getConceptSetCall

Create the Capr code to build a concept set

## Description

Create the Capr code to build a concept set

#### Usage

```
getConceptSetCall(x, name = x@Name)
```

## **Arguments**

x A concept set

name the name of the concept set

#### Value

The Capr code required to build the concept set

getConceptSetDetails Fill in Concept Set details using a vocab

#### **Description**

Concept sets created in R using the 'cs' function do not contain details like "CONCEPT\_NAME", "DOMAIN\_ID", etc. If an OMOP CDM vocabulary is available then these details can be filled in by the the 'getConceptSetDetails' function.

## Usage

```
getConceptSetDetails(x, con, vocabularyDatabaseSchema = NULL)
```

## **Arguments**

x A concept set created by 'cs'

con A connection to an OMOP CDM database

 $vocabulary {\tt Database Schema}$ 

Schema name where your OMOP vocabulary format resides. Note that for SQL Server, this should include both the database and schema name, for example 'vocabulary.dbo'.

## Value

A modified version of the input concept set with concept details filled in.

26 gt

#### **Examples**

```
## Not run:
# create a concept set
vocabularyDatabaseSchema = "cdm5"
anemia <- cs(descendants(439777,4013073,4013074))

# fill in the details from an OMOP CDM
library(DatabaseConnector)
con <- connect(dbms = "postgresq1", user = "postgres", password = "", server = "localhost/covid")
anemia <- getConceptSetDetails(condition_anemia, con, vocabularyDatabaseSchema = "cdm5")

## End(Not run)</pre>
```

Group-class

An S4 class for a group

#### **Description**

a group is the combination of multiple criteria or sub groups

#### **Slots**

occurrence an occurrence object specifying how many events must occur to consider the event as part of the cohort definition
critera a list of criteria that are grouped together
group a list of sub-groups to consider

gt

Greater than operator

## Description

function that builds an opAttribute based on greater than logic

#### Usage

```
gt(x)
## S4 method for signature 'integer'
gt(x)
## S4 method for signature 'numeric'
gt(x)
## S4 method for signature 'Date'
gt(x)
```

## **Arguments**

х

the value to used as a bound in the op logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

gte 27

gte

Greater than or equal to operator

## Description

function that builds an opAttribute based on greater than or equal to logic

## Usage

```
gte(x)
## S4 method for signature 'integer'
gte(x)
## S4 method for signature 'numeric'
gte(x)
## S4 method for signature 'Date'
gte(x)
```

#### **Arguments**

Х

the value to used as a bound in the op logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

logicAttribute-class An S4 class for a logical attribute

## Description

with a logic attribute if it is specified than we assume it is true

## **Slots**

name the name of the attribute

28 Ite

lt

Less than operator

#### **Description**

function that builds an opAttribute based on less than logic

## Usage

```
lt(x)
## S4 method for signature 'integer'
lt(x)
## S4 method for signature 'numeric'
lt(x)
## S4 method for signature 'Date'
lt(x)
```

#### **Arguments**

Х

the value to used as a bound in the op logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

lte

Less than or equal to operator

## Description

function that builds an opAttribute based on less than or equal to than logic

## Usage

```
lte(x)
## S4 method for signature 'integer'
lte(x)
## S4 method for signature 'numeric'
lte(x)
## S4 method for signature 'Date'
lte(x)
```

#### **Arguments**

Х

the value to used as a bound in the op logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

male 29

male

Add male attribute to a query

#### **Description**

```
Add male attribute to a query
Add female attribute to a query
```

## Usage

```
male()
female()
```

#### Value

An attribute that can be used in a query function An attribute that can be used in a query function

#### **Functions**

- male(): male demographic attribute
- female(): female demographic attribute

## **Examples**

```
## Not run:
# Create a cohort of males with Type 1 diabetes
t1dm <- cs(descendants(201254, 435216, 40484648))
t1dm_males <- cohort(condition(t1dm, male()))

## End(Not run)
## Not run:
# Create a cohort of males with Type 1 diabetes
t1dm <- cs(descendants(201254, 435216, 40484648))
t1dm_females <- cohort(condition(t1dm, female()))
## End(Not run)</pre>
```

measurement

Query the measurement domain

## Description

Query the measurement domain

#### Usage

```
measurement(conceptSet, ...)
```

30 nestedAttribute-class

#### **Arguments**

conceptSet A measurement concept set
... optional attributes

#### Value

A Capr Query

nbt

Not between operator

## **Description**

function that builds an opAttribute based on not between logic

## Usage

```
nbt(x, y)
## S4 method for signature 'integer'
nbt(x, y)
## S4 method for signature 'numeric'
nbt(x, y)
## S4 method for signature 'Date'
nbt(x, y)
```

## **Arguments**

У

x the left side bound of the between logic This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute

type

the right side bound of the between logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute

type

nestedAttribute-class An S4 class for a nested attribute

#### **Description**

An S4 class for a nested attribute

## **Slots**

```
name the name of the attribute conceptSet a list representing the concepts for the attribute
```

nestedWithAll 31

nestedWithAll Function to construct a nested group where all criteria and groups must be satisfied	S
--	---

#### **Description**

Function to construct a nested group where all criteria and groups must be satisfied

#### Usage

```
nestedWithAll(...)
```

## **Arguments**

... a set of criteria or groups

nestedWithAny

Function to construct a nested group where any criteria and groups may be satisfied

#### **Description**

Function to construct a nested group where any criteria and groups may be satisfied

## Usage

```
nestedWithAny(...)
```

## **Arguments**

... a set of criteria or groups

nestedWithAtLeast

Function to construct a nested group where at least some of the criteria or groups must be satisfied

## **Description**

Function to construct a nested group where at least some of the criteria or groups must be satisfied

## Usage

```
nestedWithAtLeast(x, ...)
```

#### **Arguments**

an integer specifying the number of criteria or groups that must be satisfieda set of criteria or groups

32 observationExit

nestedWithAtMost

Function to construct a nested group where at most some of the criteria or groups must be satisfied

## Description

Function to construct a nested group where at most some of the criteria or groups must be satisfied

## Usage

```
nestedWithAtMost(x, ...)
```

## **Arguments**

x an integer specifying the number of criteria or groups that must be satisfied... a set of criteria or groups

observation

Query the observation domain

## **Description**

Query the observation domain

## Usage

```
observation(conceptSet, ...)
```

## Arguments

conceptSet A condition concept set ... optional attributes

#### Value

A Capr Query

observationExit

Function to create an exit based on continuous observation

## **Description**

Function to create an exit based on continuous observation

## Usage

```
observationExit()
```

ObservationExit-class 33

ObservationExit-class An S4 class for a cohort exit based on end of continuous observation.

#### **Description**

The event persists until the end of continuous observation of the persons

#### **Slots**

index specification of event date to offset offsetDays an integer specifying the number of days to offset from the event date

ObservationWindow-class

An S4 class for an ObservationWindow

## Description

this determines the minimal observation time before and after index for all persons in the cohort

#### **Slots**

priorDays minimum number of days prior to the cohort index postDays minimum number of days post cohort index

Occurrence-class

An S4 class for an occurrence.

## Description

This determines how many events need to occur to count the criteria in the cohort definition (relative to the index event)

## Slots

type a character string determine the logic for counting occurrences. Can be all, any, exactly, atLeast, or atMost

count an integer specifying the number of occurrences for a criteria

opAttributeDate-class An S4 class for a op attribute that is a date

## Description

An S4 class for a op attribute that is a date

#### **Slots**

```
name the name of the attribute

op the operator one of: gt,lt,gte,lte,eq,bt,!bt

value a value serving as the single limit or lower limit in a bt.

extent a value serving as the upper limit in a bt, otherwise this is empty
```

opAttributeInteger-class

An S4 class for a op attribute that is an integer

#### **Description**

An S4 class for a op attribute that is an integer

#### **Slots**

```
name the name of the attribute

op the operator one of: gt,lt,gte,lte,eq,bt,!bt

value a value serving as the single limit or lower limit in a bt.

extent a value serving as the upper limit in a bt, otherwise this is empty
```

opAttributeNumeric-class

An S4 class for a op attribute that is a numeric

## **Description**

An S4 class for a op attribute that is a numeric

#### Slots

```
name the name of the attribute

op the operator one of: gt,lt,gte,lte,eq,bt,!bt

value a value serving as the single limit or lower limit in a bt

extent a value serving as the upper limit in a bt, otherwise this is empty
```

procedure 35

procedure

Query the procedure domain

#### **Description**

Query the procedure domain

#### Usage

```
procedure(conceptSet, ...)
```

## **Arguments**

conceptSet A procedure concept set ... optional attributes

#### Value

A Capr Query

Query-class

An S4 class for a Circe Query

#### **Description**

A query is a medical concept that can be extracted from a database through a 'where' clause in a SQL statement. This includes concepts.

#### **Slots**

```
domain The domain to search (e.g. "Condition", "Drug", "Measurement", etc) conceptSet The Concept set describing the observation to serach for attributes a list of attributes that modify the query (e.g. 'male()', 'female()', 'age(gte(65))')
```

rangeHigh

Function to create rangeHigh attribute

#### **Description**

This function is used only for measurement query. range\_high is a column in the measurement table of the cdm. This attribute allows a subquery to find measurements that satisfy certain values determined by the op logic.

## Usage

```
rangeHigh(op)
```

#### **Arguments**

ор

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible range high

36 readConceptSet

rang	el ow
I alig	CLOW

Function to create rangeLow attribute

#### **Description**

This function is used only for measurement query. range\_low is a column in the measurement table of the cdm. This attribute allows a subquery to find measurements that satisfy certain values determined by the op logic.

#### Usage

```
rangeLow(op)
```

#### **Arguments**

op

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible range low

readConceptSet

Read a concept set json or csv into R

## Description

Concept sets can be serialized to json or csv file formats. 'readConceptSet' reads the files into R as Capr concepts sets.

## Usage

```
readConceptSet(path, name, id = NULL)
```

## Arguments

path Name of concept set file to read in csv or json format. (e.g. "concepts.json")

name the name of the concept set

id the id for the concept set (keep?)

## **Examples**

```
## Not run:
anemia <- readConceptSet('anemia.json')
anemia <- readConceptSet('anemia.csv')
## End(Not run)</pre>
```

startDate 37

startDate

Function that creates a start date attribute

## **Description**

Function that creates a start date attribute

#### Usage

```
startDate(op)
```

#### **Arguments**

ор

an opAttribute object must be a date that defines the logical operation used to determine eligible start dates

toCirce

Function to coerce cohort to circe

## **Description**

Function to coerce cohort to circe

#### Usage

toCirce(cd)

## **Arguments**

cd

the Capr cohort class

unit

Add unit attribute to a query

## Description

Add unit attribute to a query

## Usage

unit(x)

#### **Arguments**

Χ

A single character idetifier for a unit or a concept set that identifies units

## Value

An attribute that can be used in a query function

38 visit

## **Examples**

```
## Not run:
# create a unit attribute
unit(8713L)
unit("%")
## End(Not run)
```

valueAsNumber

Function to create valueAsNumber attribute

## Description

This function is used only for measurement query. valueAsNumber is a column in the measurement table of the cdm. This attribute allows a subquery to find measurements that satisfy certain values determined by the op logic.

## Usage

```
valueAsNumber(op)
```

#### **Arguments**

ор

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible patient age

visit

Query the visit occurrence domain

## Description

Query the visit occurrence domain

#### Usage

```
visit(conceptSet, ...)
```

## Arguments

```
conceptSet A condition concept set
... optional attributes
```

#### Value

A Capr Query

withAll 39

withAll	Function to construct a group where all criteria and groups must be satisfied
	•

## Description

Function to construct a group where all criteria and groups must be satisfied

#### Usage

```
withAll(...)
```

## **Arguments**

... a set of criteria or groups

withAny

Function to construct a group where any criteria and groups may be satisfied

#### **Description**

Function to construct a group where any criteria and groups may be satisfied

## Usage

```
withAny(...)
```

## **Arguments**

... a set of criteria or groups

withAtLeast

Function to construct a group where at least some of the criteria or groups must be satisfied

## Description

Function to construct a group where at least some of the criteria or groups must be satisfied

## Usage

```
withAtLeast(x, ...)
```

#### **Arguments**

an integer specifying the number of criteria or groups that must be satisfieda set of criteria or groups

40 writeCohort

withAtMost

Function to construct a group where at most some of the criteria or groups must be satisfied

## Description

Function to construct a group where at most some of the criteria or groups must be satisfied

## Usage

```
withAtMost(x, ...)
```

## Arguments

x an integer specifying the number of criteria or groups that must be satisfied

... a set of criteria or groups

writeCohort

Write Cohort json file

## Description

Write Cohort json file

## Usage

```
writeCohort(x, path)
```

## Arguments

x A Capr cohort

path The name of the file to create

## **Examples**

```
## Not run:
cs1 <- cs(descendants(exclude(436665),440383,442306,4175329))
cs1 <- getConceptSetDetails(cs1)
x <- cohort(condition(cs1))
writeCohort(x, "cohortDefinition.json")
## End(Not run)</pre>
```

writeConceptSet 41

writeConceptSet

Save a concept set as a json file

## Description

The resulting concept Set JSON file can be imported into Atlas.

## Usage

```
writeConceptSet(x, path, format = "auto", ...)
```

#### **Arguments**

```
x A Capr concept set created by 'cs()'
path Name of file to write to. (e.g. "concepts.json")
format the file extension to write
... additional arguments
```

## **Examples**

```
## Not run:
anemia <- cs(descendants(439777,4013073,4013074))
writeConceptSet(anemia, 'anemia.json')
writeConceptSet(anemia, 'anemia.csv')
## End(Not run)</pre>
```
